Indefinite Integral

Integration: The process of finding an anti-derivative or integral of a function is called integration. It is the inverse process of differentiation. If $f(x)$ be a function of x related with another function $F(x)$ in such a way that

$$\frac{d}{dx}\left[F(x)\right]=f(x)$$

then

$$\int f(x)dx=F(x)+c$$

which is called an indefinite integral of $f(x)$ with respect to x.

where $f(x)$, $F(x)$ and c are called integrand, integral and constant of integration respectively.

And

$$\int_a^b f(x)dx=F(b)-F(a)$$

which is called the definite integral of $f(x)$ from a to b, and 'a' is called the lower limit and 'b' the upper limit of the definite integral.

Fundamental Properties:

1. $\int\left[f_1(x)\pm f_2(x)\pm\ldots\ldots\ldots \text{ to } n \text{ terms}\right]dx=\int f_1(x)dx\pm\int f_2(x)dx\pm\ldots\ldots \text{ to } n \text{ terms}$.
2. $\int cf(x)dx=c\int f(x)dx$

where c is a constant.

Integration Formulas:

1. $\int x^n dx=\dfrac{x^{n+1}}{n+1}+c \quad where\ (n\neq -1)$.

Method of substitution

Sometimes, the integration of given integral $\int f(x)dx$ is relatively difficult. In this case, we can replace x by $\varphi(z)$ and dx by $\varphi'(z)dz$ for integrating easily. This process is known as method of substitution.

Integration by Parts

The formula for the integration of a product of two functions is referred to as integration by parts. *i.e,*

$$\int (uv)dx = u\int vdx - \int \left\{ \frac{du}{dx} \int vdx \right\} dx.$$

While applying the above rule for integration by parts to the product of two functions, care should be taken to choose properly the first function, i.e., the function not to be integrated.
